

Weather App Using React. Js Project Description

A weather application gives users access to up-to-the-minute weather data, forecasts, and alerts for their specific area. Key features usually include:

- 1. Current Weather:** Shows temperature, humidity, wind speed, and overall weather conditions (like sunny or rainy).
- 2. Forecasting:** Provides hourly and daily forecasts, indicating expected temperatures and changes in weather.
- 3. Maps and Radar:** Features visual weather maps and radar images for tracking storms and precipitation.
- 4. Severe Weather Alerts:** Sends notifications for extreme weather warnings, including storms and heatwaves.
- 5. Location Services:** Automatically detects the user's location for tailored weather updates or lets users search for different areas.
- 6. Customization Options:** Users can often adjust settings for notifications, choose between Celsius or Fahrenheit, and modify display preferences.
